

Heart Portrait

The heart can be a symbol of something you love. Half a heart is missing, use your imagination to draw out the other half that makes your heart whole!

Learn with Echo!

Hi everyone, Echo and Vienna here! It's time to kick back, relax, and unwind! Every day, we face stressors that turn on our bodies' automatic stress-detection mechanism called the **sympathetic nervous system** (SNS). Whether it's studying, running late, or even facing danger, our bodies are working hard to keep us alert! In order to shake off any stress we might face, our bodies also have an automatic way to calm down called the **parasympathetic nervous system** (PNS). To help turn on our PNS, we can practice mindfulness, gentle movement, creativity, and gratitude.

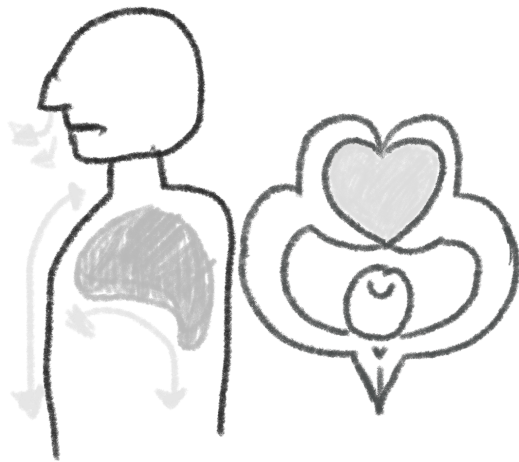

Echo's Breathing Routine

Make your Echo heart hands.

When you breathe in, move your heart down to your chest to represent the air filling up your lungs.

When you breathe out, move your heart up over your head to represent the air leaving your lungs.
